

2022-10-17 Start: 11am (local time)

Location: NANOG 86

Participants: Steve, Pete, Grizz, Leo

Main agenda

- Carrier object
 - Go/no go? Answer is go!
 - What is the minimum scope we can deliver?

Carrier is present in a facility plus contact information

- Name, contact info, notes field etc... then which facilities they have a presence in `carrierfac`
 - Must have permissions to allow the facility to accept/deny the association request
 - No `carrierix` for now. That could be a future development.
 - Need to make sure the purpose is very clear in the creation form and review the first few registrations
-
- CDN deployment
 - Static objects only?
 - Cost for data egress from AWS?
 - CDNs to consider?

Let's try Google Analytics for `beta.peeringdb.com` to see what data we get and whether we should use a different product.

Let's try pushing the whole database to a CDN to see if we can improve user experience without raising costs.

AOB

Discussed the survey and another request for a feature that allows users to be notified of changes at IXPs and Facilities. Will work on use cases and the best way to do this: a PeeringDB feature, or code to be run by the user, or something else.
